

## Working scientifically Year 4 Teeth (eggs) in Liquids

What do you think will happen? Why?

Why have some decayed more than others?

What do you think is in the liquid that is making this happen?

Where there any surprises?

To make observations over a period of time

To record observations over a period of time

To describe differences

To use the results to make simple conclusions

To suggest explanations for their findings

To suggest further questions that could be investigated

What other questions would you like to investigate and how could you do this?

What would happen if the eggs were cleaned daily with toothpaste?

How is this similar to your teeth? How is it different?
